"IN MIND" APPLICATION

CONTEXT

The Application that has been proposed is for an intuitive health tracking service, called "In Mind", its main purpose will be to help users whose day to day lives are affected by a disability or health condition.

REASON

My reason for choosing this type of application is personal, suffering from epilepsy myself I struggle with remembering when to take my medication, tracking my seizures, sleeping, general emotional stress. There aren't many applications that offer what I'm proposing at least not in a user friendly or aesthetic way.

DELIVERABLES

Product:

- Logo & graphics
- possible prototype
- 3D application mock-up artefact.
- pill mascot, similar to "clippy"

Design Process:

- application wireframes.
- audience personas and demographics.
- digital sketchbook, documenting the process.

AUDIENCE

Age: 25 – 34 years old, Gender: male & female – based on competitors we can expect a higher number of female users being drawn to the application services.

CHALLANGE

Utilizing customizable functionality, where the user can modify the application to be suited to their specific needs and requirements. It will contain multiple functions for users to pick and choose from such as, the calendar which will help users to keep track of their medication with notifications and updates about what and when they should be taking them, an emotional tracker and journal where users can input notes about how they are feeling throughout the week and possible effects of medication to refer to doctors.

THE PROBLEM

To create a visually aesthetic mobile application with a streamlined user interface, specific for users with disabilities to keep track of their condition, medication and emotional level.

" THE HEALTH SURVEY FOR ENGLAND, 2016' SHOWED THAT 48% OF ADULTS IN THE COUNTRY HAD TAKEN AT LEAST ONE PRESCRIBED MEDICINE "

FEATURES

Wellbeing Centre

The main screen users will be greeted with, where they can access features for the application

Calendar

main tracker for users to input their medications and times they should take it

Operation Hub

Section of the application where users can customize their application to fit their preferences
