# WHAT WE AIM TO ACHIEVE

A unique and functional mobile app, that gives control back to the user by allowing them to access any Bluetooth or infrared device in their home at the touch of a button.

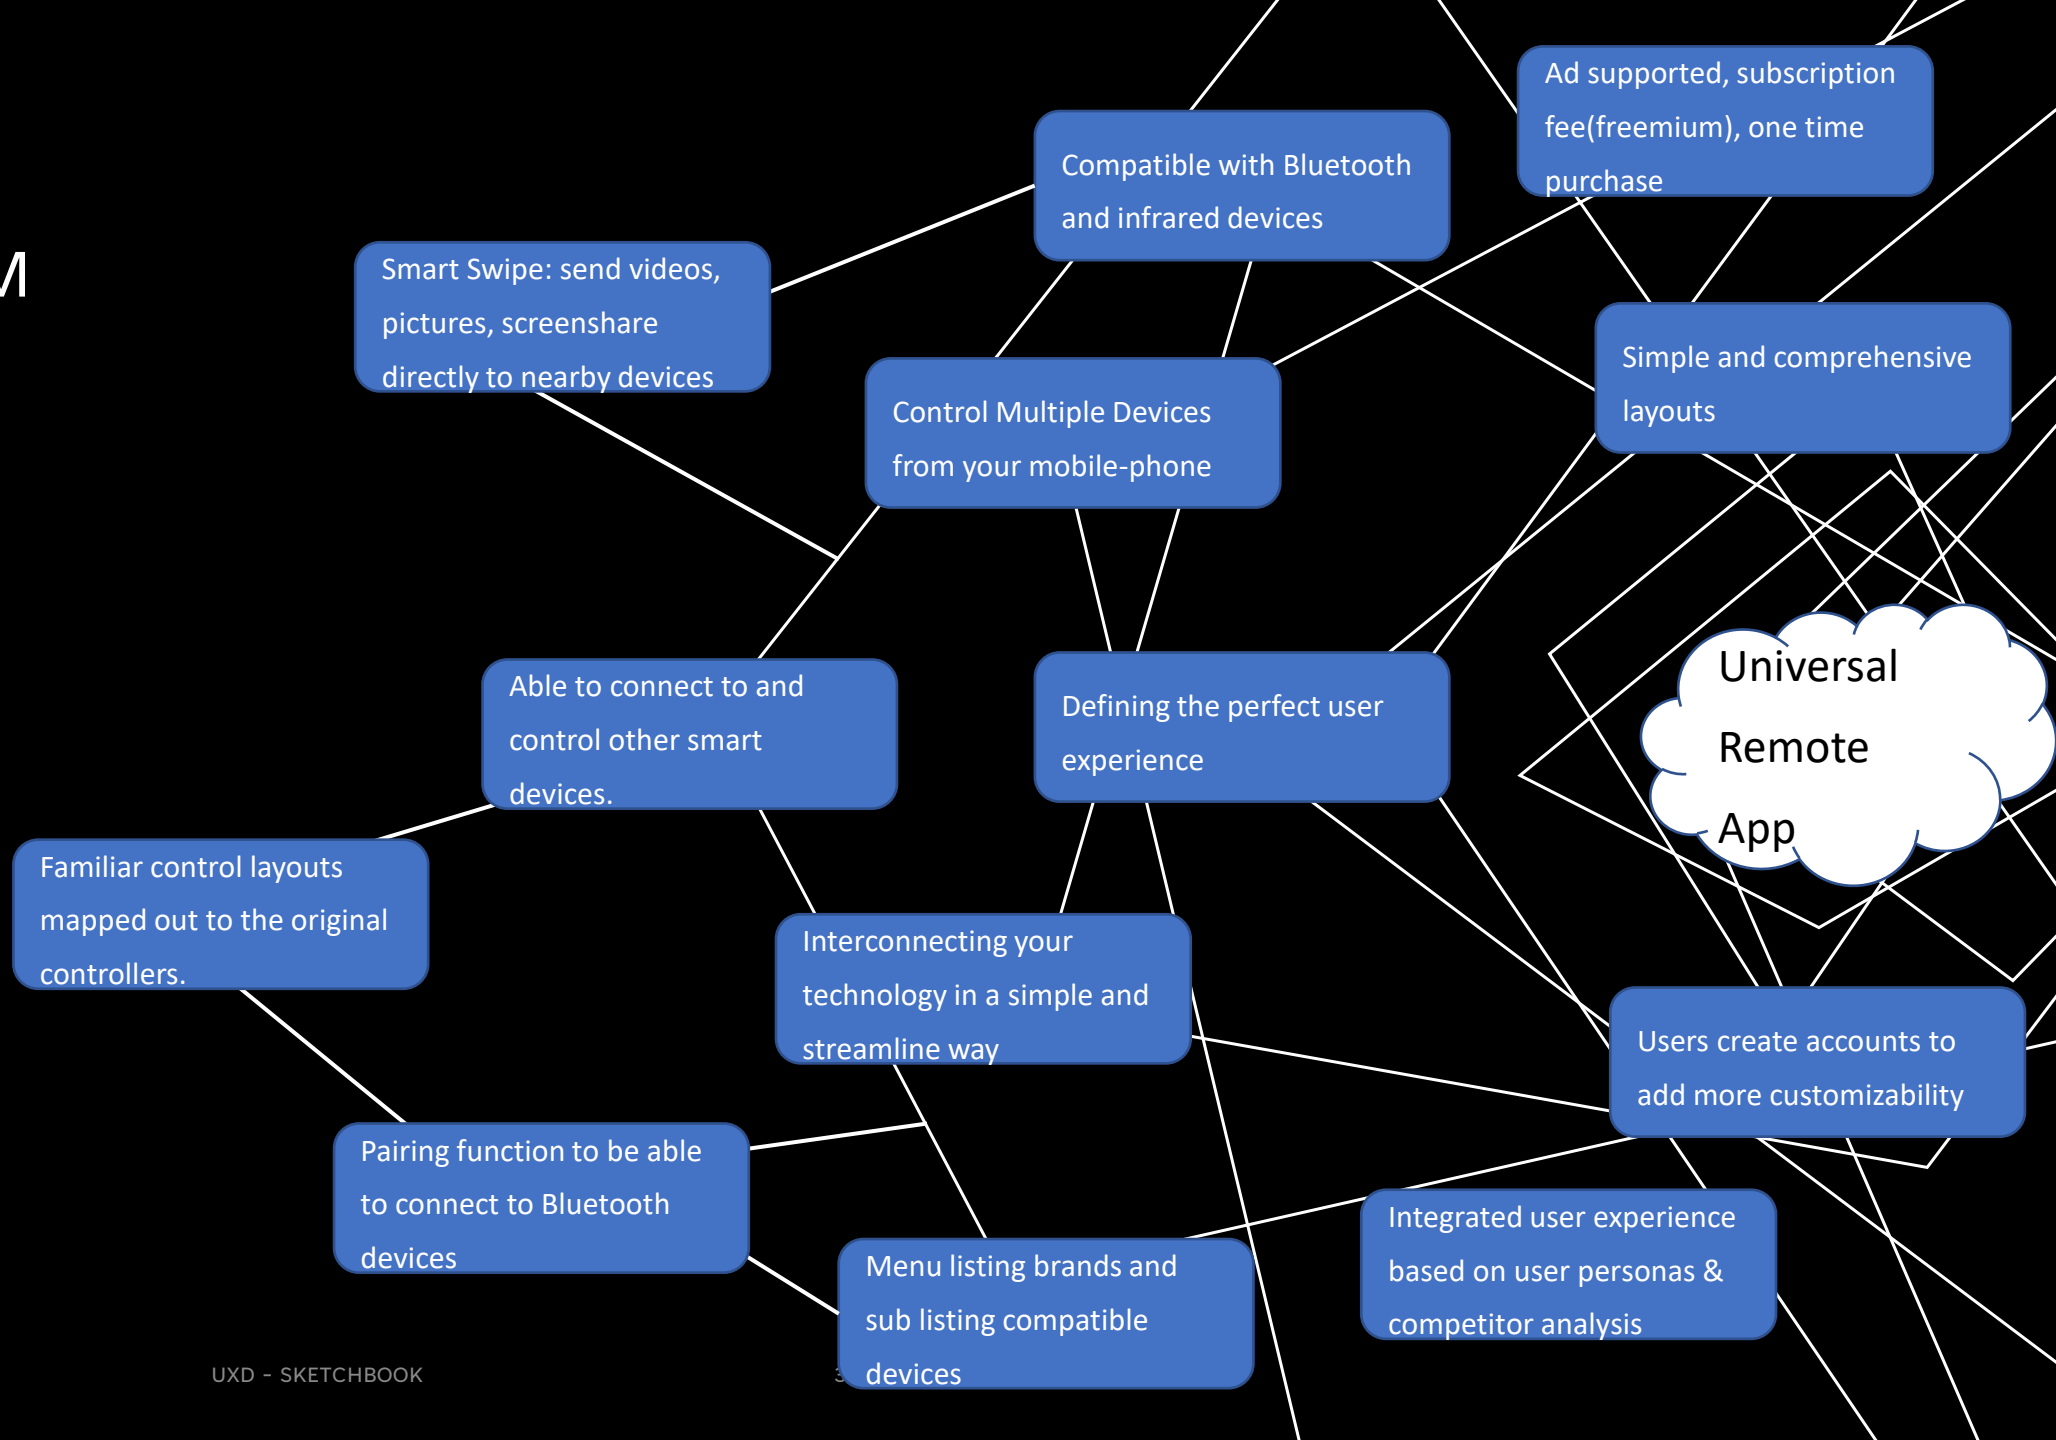

Taking it a step further, we would like to be able to include the ability to not just control your TVs and speakers but other smart devices as well.

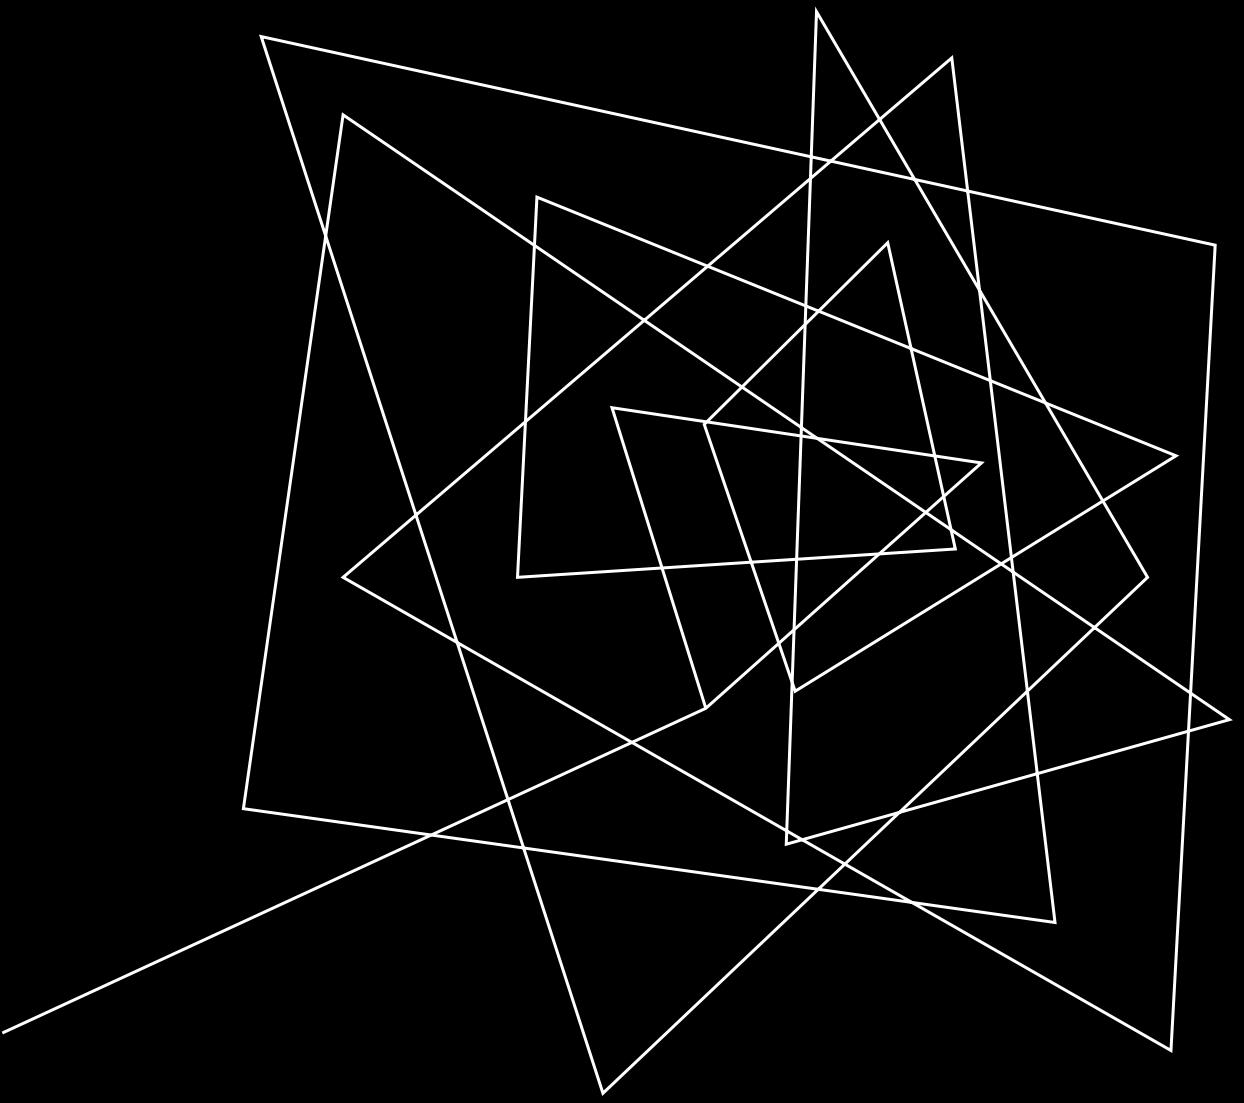

Imagine being able to control near every device in your home from your phone screen, presentations in your office presented directly from your smart phone without having to download or transfer any of the actual files

UNIVERSAL REMOTE

# CONCEPT BRAINSTORM

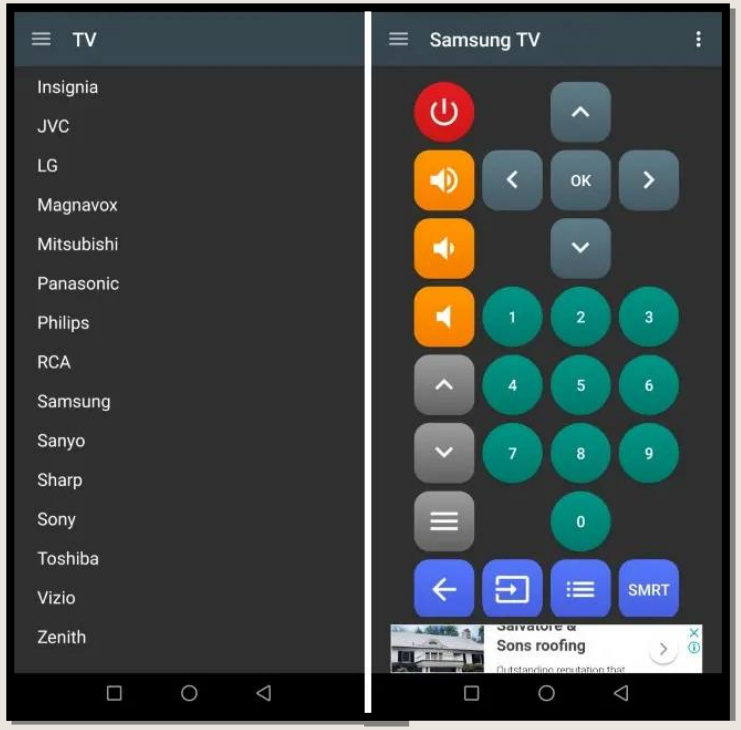

# THE USER EXPERIENCE

Good vs bad, experience maps, user journey, personas

# COMPETITOR ANALYSIS – CRITIQUES

## Twinone Universal TV Remote

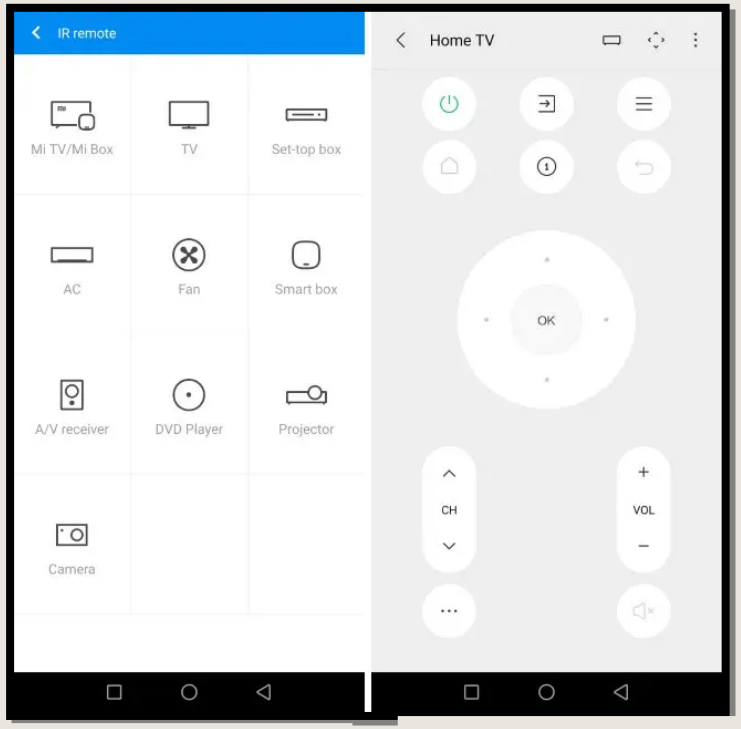

Good

- List of familiar brands to choose from.
- Inbuilt troubleshooting for connection issues.

Bad

- Simplified layouts different to the original controllers.
- Poorly sized banner ads

## Mi Remote Controller

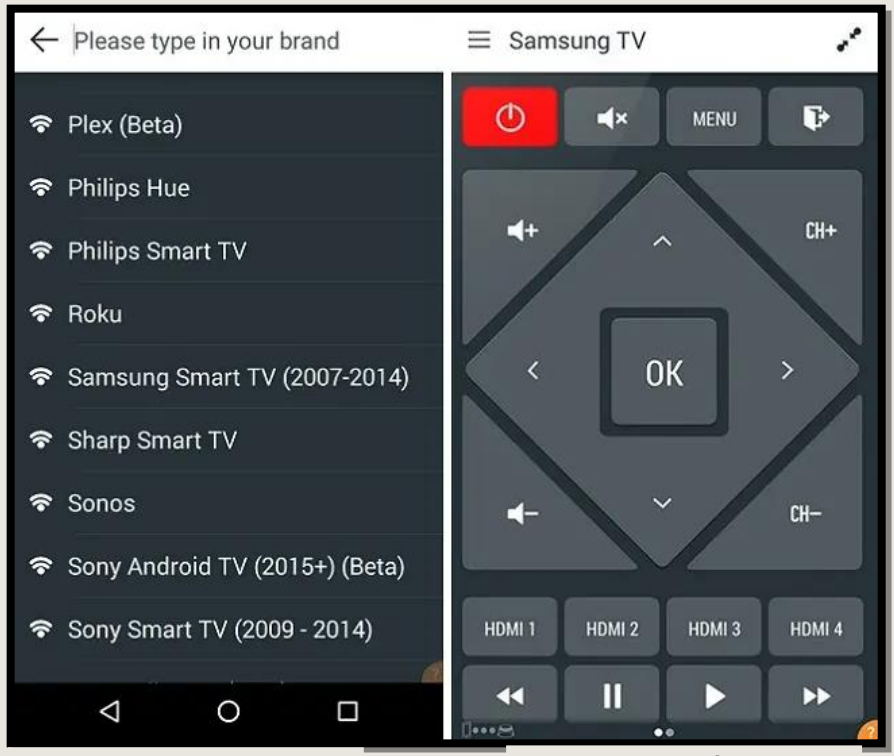

Good

- Works with a plethora of devices, from fans to tv's
- Supported on multiple mobile devices.

Bad

- Far too bland & minimalistic.
- No branded controller layouts.
- Everything's too similar making it hard to differentiate.

## Smart IR Remote – AnyMote

Good

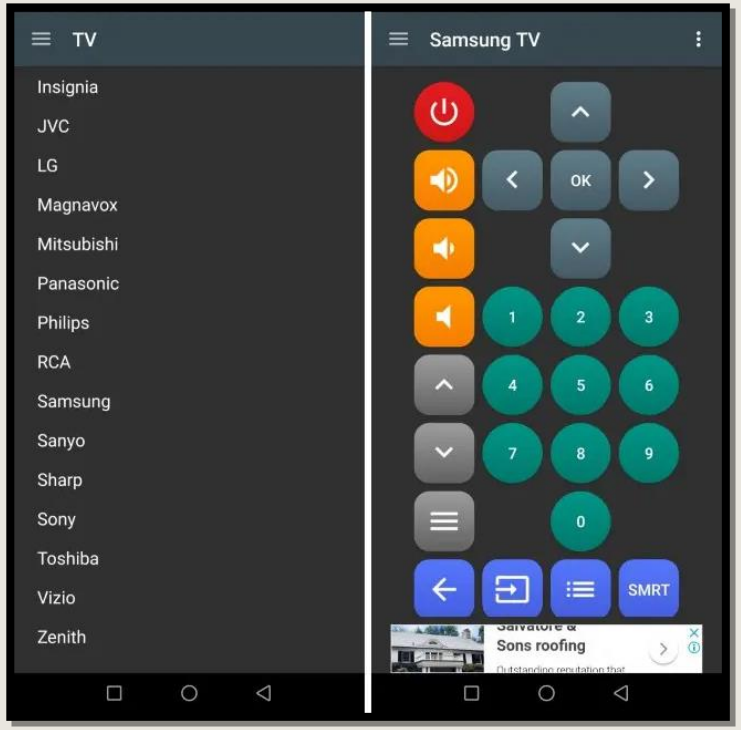

- Search bar, indexing hundreds of devices.
- Familiar controller layouts.

Bad

- Limitations in the free version.
- Offering a full version that must be purchased.

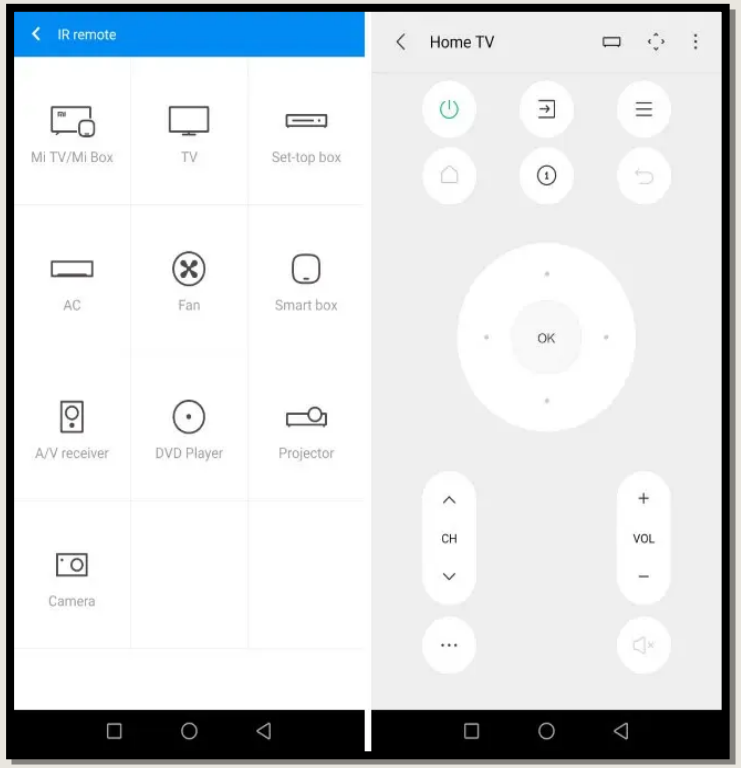

# COMPETITOR ANALYSIS – IMPROVING UX

## Twinone Universal TV Remote

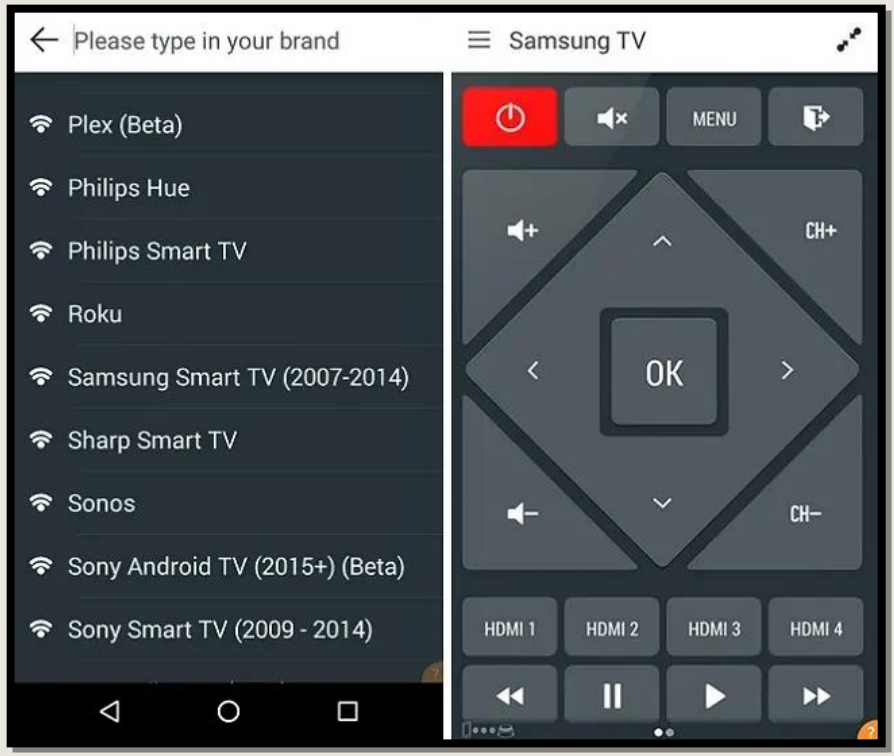

- The button layouts could be more like the original remotes they're trying to mimic, for a sense of ease and familiarity for the users.
- Search bar so users can easily lookup the device they're trying to connect to and control.

## Mi Remote Controller

- Improvements to overall design, button layouts, colour scheme, borders and icons. Everything looks too similar its hard to differentiate.
- Include different layouts and sections for different types of branded device.
- Labeling, for some of the buttons where users may not be familiar with certain symbols

## Smart IR Remote – AnyMote

- Oversized buttons taking up too much of the screen, with unnecessary number of buttons for different HDMI's, could be condensed into a single button that cycles through the source.
- Doesn't allowing pairing and adding of new remotes only ones they have listed – add pairing button for new devices.

# USER PERSONAS

JENNY

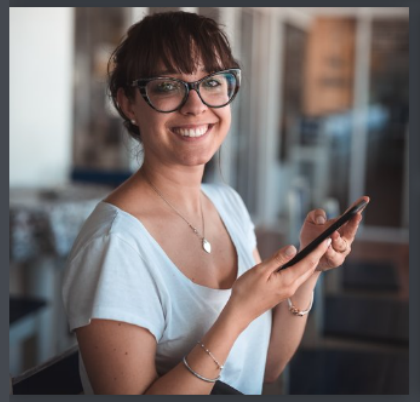

## Universal Control App

MARKET SIZE

55 %

TYPE

**Artisan**

### Drivers and motivators

wanting to help reduce carbon emissions and pollution by using innovative and forward thinking new technologies.

### Fears and challenges

I Have trouble with being able to find the various remotes for all of my devices around the house, it would be so much easier if i could use one remote to control everything.

I don't like having to pay subscription fees for the services i use on a regular basis.

USER PERSONA

## Jeff Lee

### ABOUT

Jeff is a professional tech Blogger who is passionate about design in some of the newest and upcoming web spaces and mobile applications.

He has many years of education and knowledge about design from studying user experience design and digital editing in college and university.

### PREFERENCES

- Mobile Applications ●●●●●
- Video Games ●○○○○
- Retro Technology ●○○○○
- Technology Blogs ●●●●○
- Web Applications ●●●○○

### GOALS

- ✓ To be able to send and receive media files quickly and simply with a single swipe across his phone screen.
- ✓ Quick and interactive technology that can be controlled from the palm of your hand.

### PAIN POINTS

- ▲ Its difficult to be able to interconnect and control multiple devices from a single remote control.
- ▲ It can be expensive to replace remote controls and its also bad for the environment with lots of excess waste i.e. batteries.

### HABITS

- Always connects any new device straight to the internet and pairs with mobile.
- Normally updates any software or apps as soon as they're available.
- Very sensitive to information being stolen or watched.

### FAVORITE BRANDS

# USABILITY TEST:

Defining the audience:

- The purpose of Uni-Mote is to allow for fast and simple connectivity to all your devices.
- Customers may be people with maneuverability issues who struggle with getting around their home.
- Uni-mote will allow users to be able to present their phone screens on paired devices.

5 tasks the user wants to achieve:

1 – the user should be able to link the app with any controller ready device.

2 – being able to control their tv/computer from their mobile smart phone.

3 - transfer files from one device to another with the smart swipe.

4 – search for and find nearby devices, Bluetooth, Infrared, Wi-fi.

5 – create custom remotes with customized layouts saved to the menu.

Task 1:

The user must choose the setting they wish to pair a specific device to, for this instance, wi-fi, pairing the app with a wi-fi device such as a smart TV or thermostat.

Task 2:

The user must attempt to control one of their devices from the Uni-mote app.

Task 3: successfully transfer a media file from the Uni-mote app to another device, i.e smart board.

Task 4: use search function to see all available devices that you can connect to.

Task 5:

Be able to create a personalized remote layout for your own ease.

# USER JOURNEY MAP

**Johhny Cockston**

*"Archetype"*

Age: 23
Occupation: Cafe
Location: UK

**Biography**

Fresh out of university, johnny has recently started his new job at a small cafe in his home town, he studied computer programing making him a perfect candidate for trying out our new universal remote mobile app.

| Journey steps | Awareness | Consideration | Acquisition | Service | Loyalty |
|---|---|---|---|---|---|
| User actions | Johnny has heard of a new universal remote app that offers users the ability to control their bluetooth and infrared devices, he was made aware through an advertising campaign. | After loosing an expensive remote that would require ordering direct from the supplier johnny considers downloading the app hes heard about. | downloading the app from the appstore and trying out its features on his home devices to see if it actually delivers on promises | while using the app, johnny realises that hed be able to control nearly all of his devices from his phone. pushing him to further consider long standning use of the app | after getting used to the layout and functions of the new app johnny would happily subscribe to the service at a fee. |
| Goals and experiences | "My remote broke, and I thought—wouldn't it be great if my phone could be my TV remote, they should invent that & so I check the Apple store for my million dollar idea and here it is! But in all seriousness it works so well, was a breeeeze to set up (connects to TV through WiFi) ! I ended up paying the £5 for no ads, since I am using it as my primary remote, but that is still much cheaper then a replacement ! To think every time you're wondering where the remote is you can now just use your phone !" - Quote From Review of Universal Remote App | | | | |
| Feelings and thoughts | Johnny is ecstatic that he has found an app that allows him to take control over all the devices in house with one single remote. | | He feels the layout is very basic and could do with some more refining to make it easier for users to interact with. | Not too happy about having to pay on a subscription service, perhaps a reduction in service fees. | |
| Opportunities | | improvements can be made to the overall design of the app to make it easier for users to navigate in the long run. | | the app offers users the ability to control their many devices through just one conduit, your mobile phone. | |
| Pain points | subscription fees, some users may not be happy with the subscription based service. however an ad-supported version will be avialable. | | the app doesnt have the best layout, modifications could be made in partnership to make the layouts mimic whatever device users wish to control | | partnerships, NOT being able to control devices that have not made partnerships or wish to be involved with the universal remote. |

ADD A STICKY

The journey map has showed us that users may be inclined to start using the app after hering about it through third party advertisments or through word of mouth.

ollie

We can learn from this information that users are happy to pay a subscription based fee to use the services but may become upset if asked to pay too much.

ollie

improvements could yet be made to the design and layut of the app to make things more streamlined towards the user experience.

# EXPERIENCE MAPS

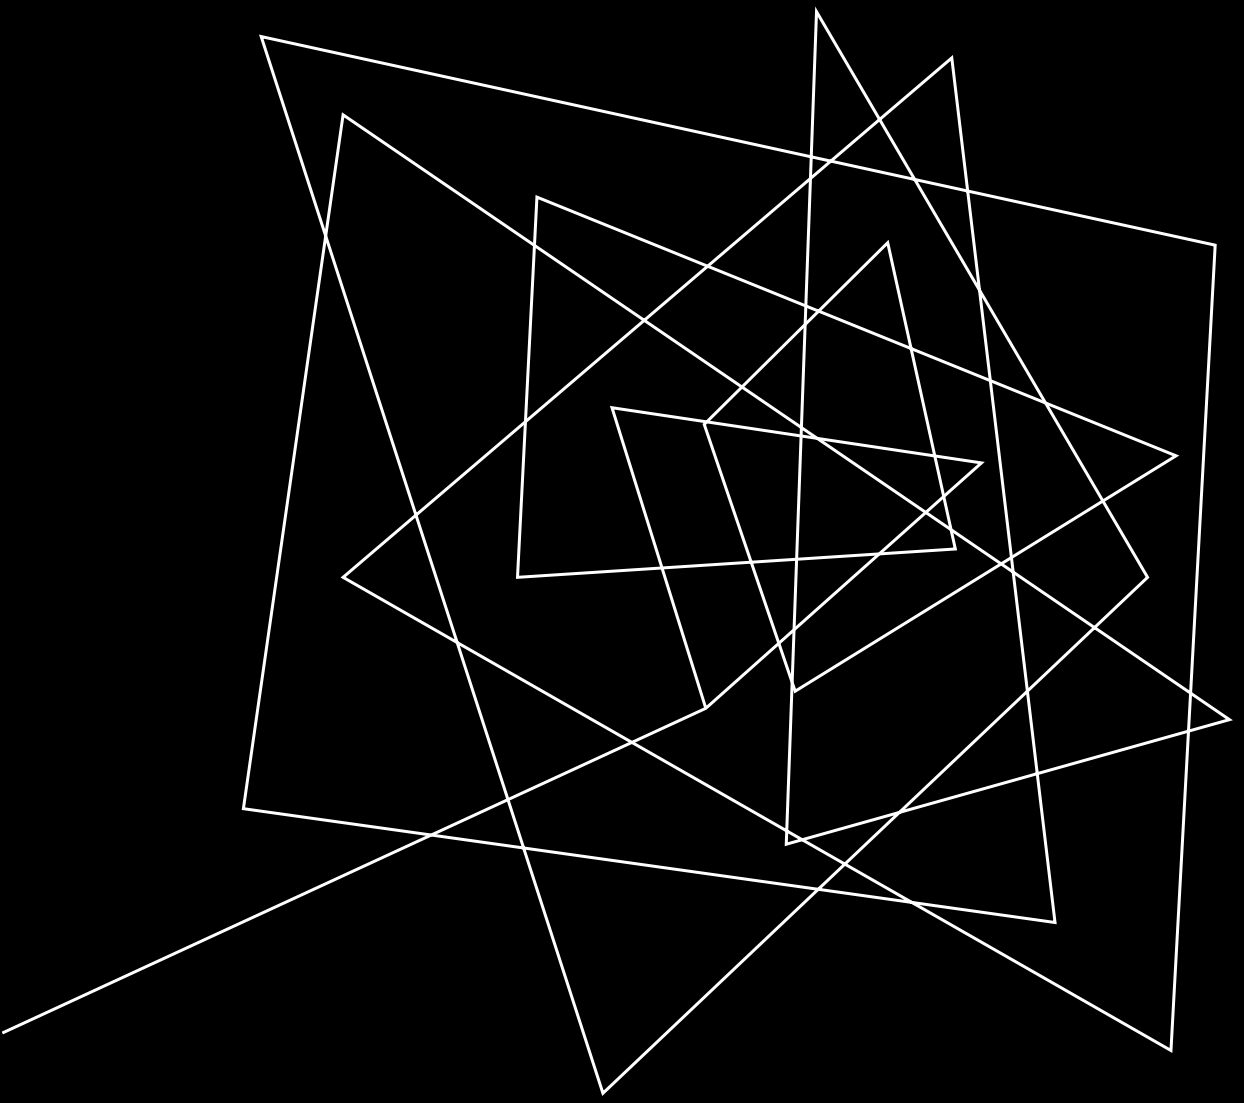

Limitations

Questions

Journey Steps

Pain Points

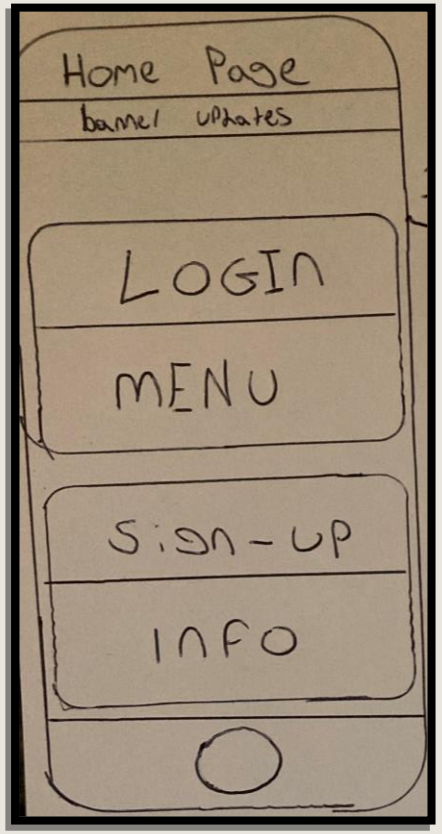

# DESIGN ITERATION

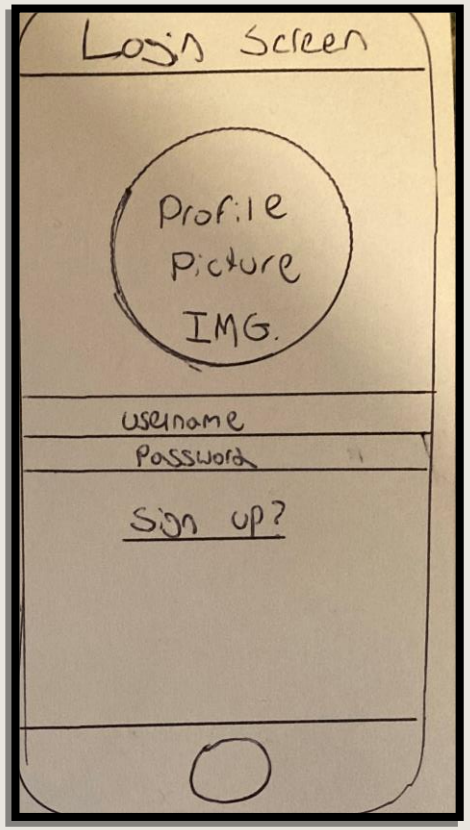

Sketches, scenarios, mock-ups, improvements

# WIREFRAME SKETCHES

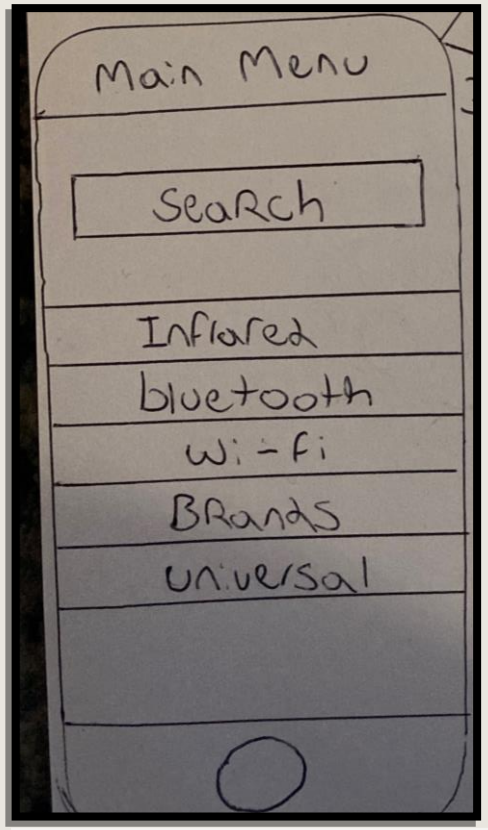

Home Page:

The first screen users will interact with when opening the mobile app.

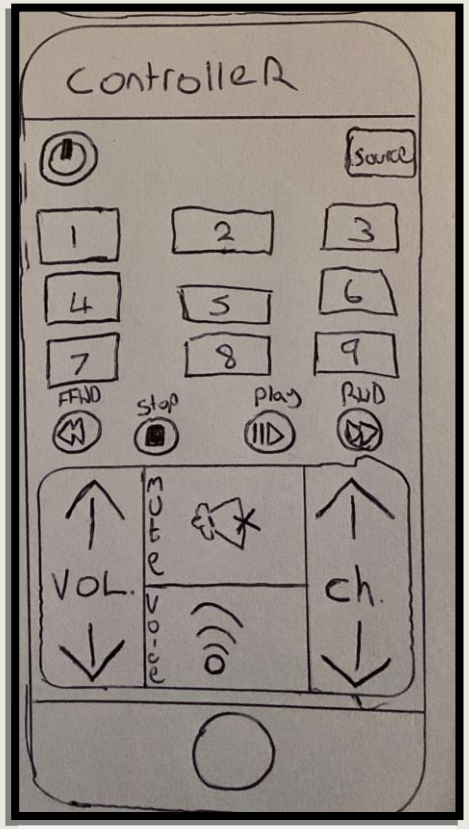

Login Screen:

Where new users will be able to create an account for more customization and functionality.

Main Menu:

Select from a variety of remote-control categories, layouts and brands.

Controller:

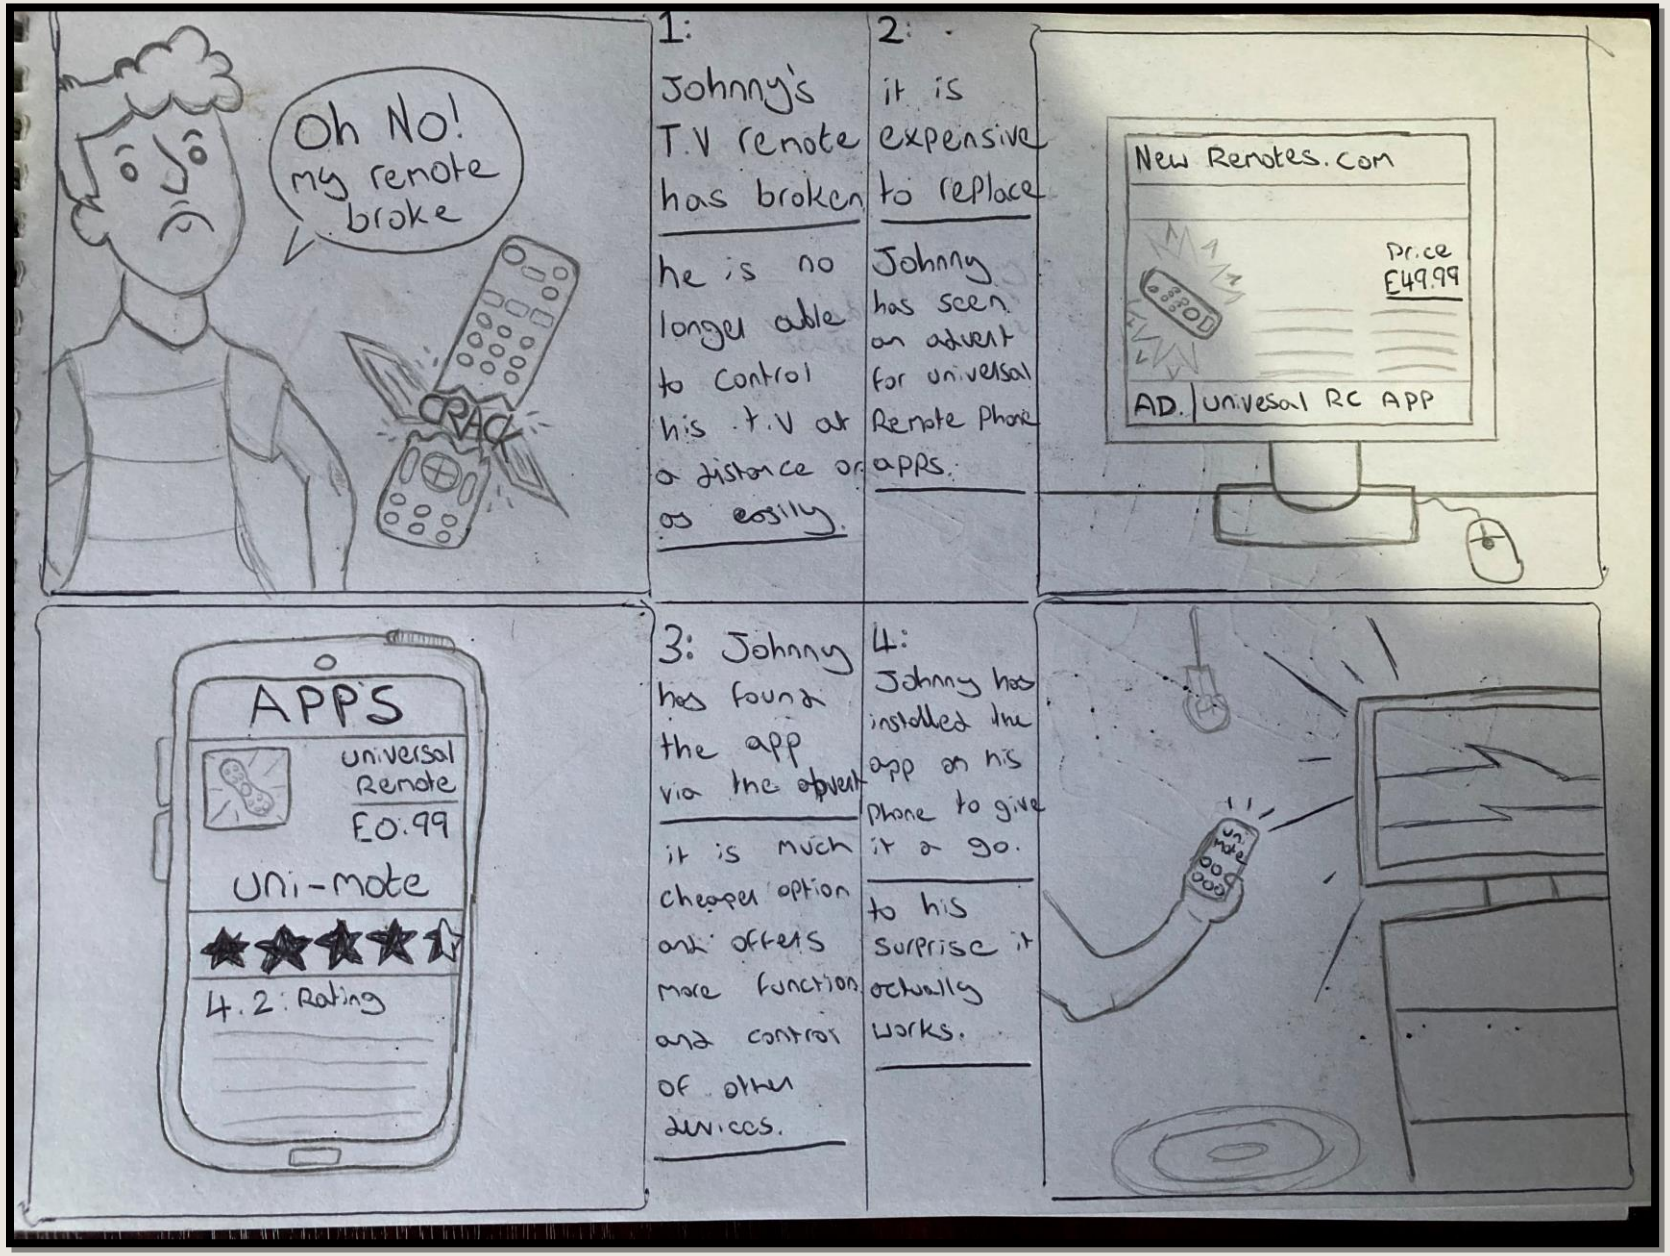

Button layouts matched to specific devices for users to be able to control the device they select.

# SCENARIO 1: BROKEN REMOTE

A scenario that the user may encounter and how they would navigate through it.

1: The user (johnny) has accidently broken his television remote.

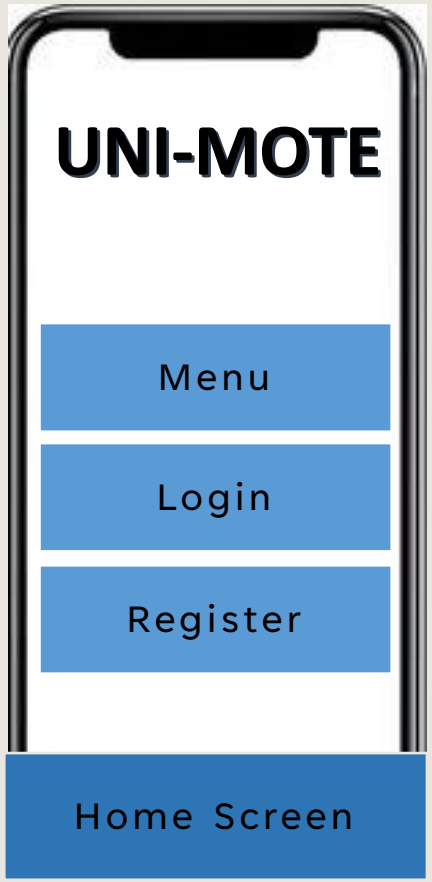

3: after seeing the add online, johnny has found the app in the app store. Where he can quickly download it for much cheaper than a replacement remote.

2: searching on the computer johnny has found out a replacement remote would be very expensive to buy and he would have to wait for it to be delivered.

4: having downloaded the app to see if it works to Johnny's surprise, he is able to use it to control his television.

# PROTOTYPE DEVELOPMENT

Home Screen

The welcome screen users will use as a portal for logging into and registering an account.

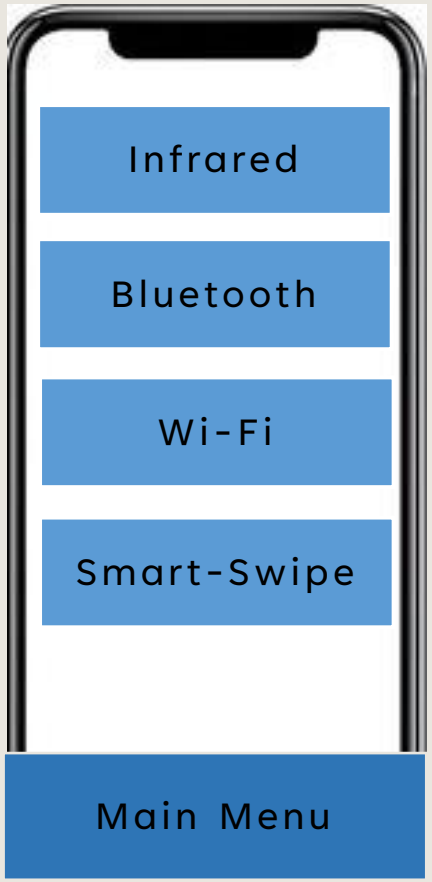

Register

New users will be able to create an account for their Uni-Mote app giving them extended functionality.

Login

Login screen for existing users to sign into and access their saved settings and personal preferences.

Main Menu

The menu where users can select from the various options, Bluetooth, infrared, wi-fi and the smart swipe.

Smart Swipe

The experimental feature yet to be implemented, would allow users to send media across devices with a single swipe

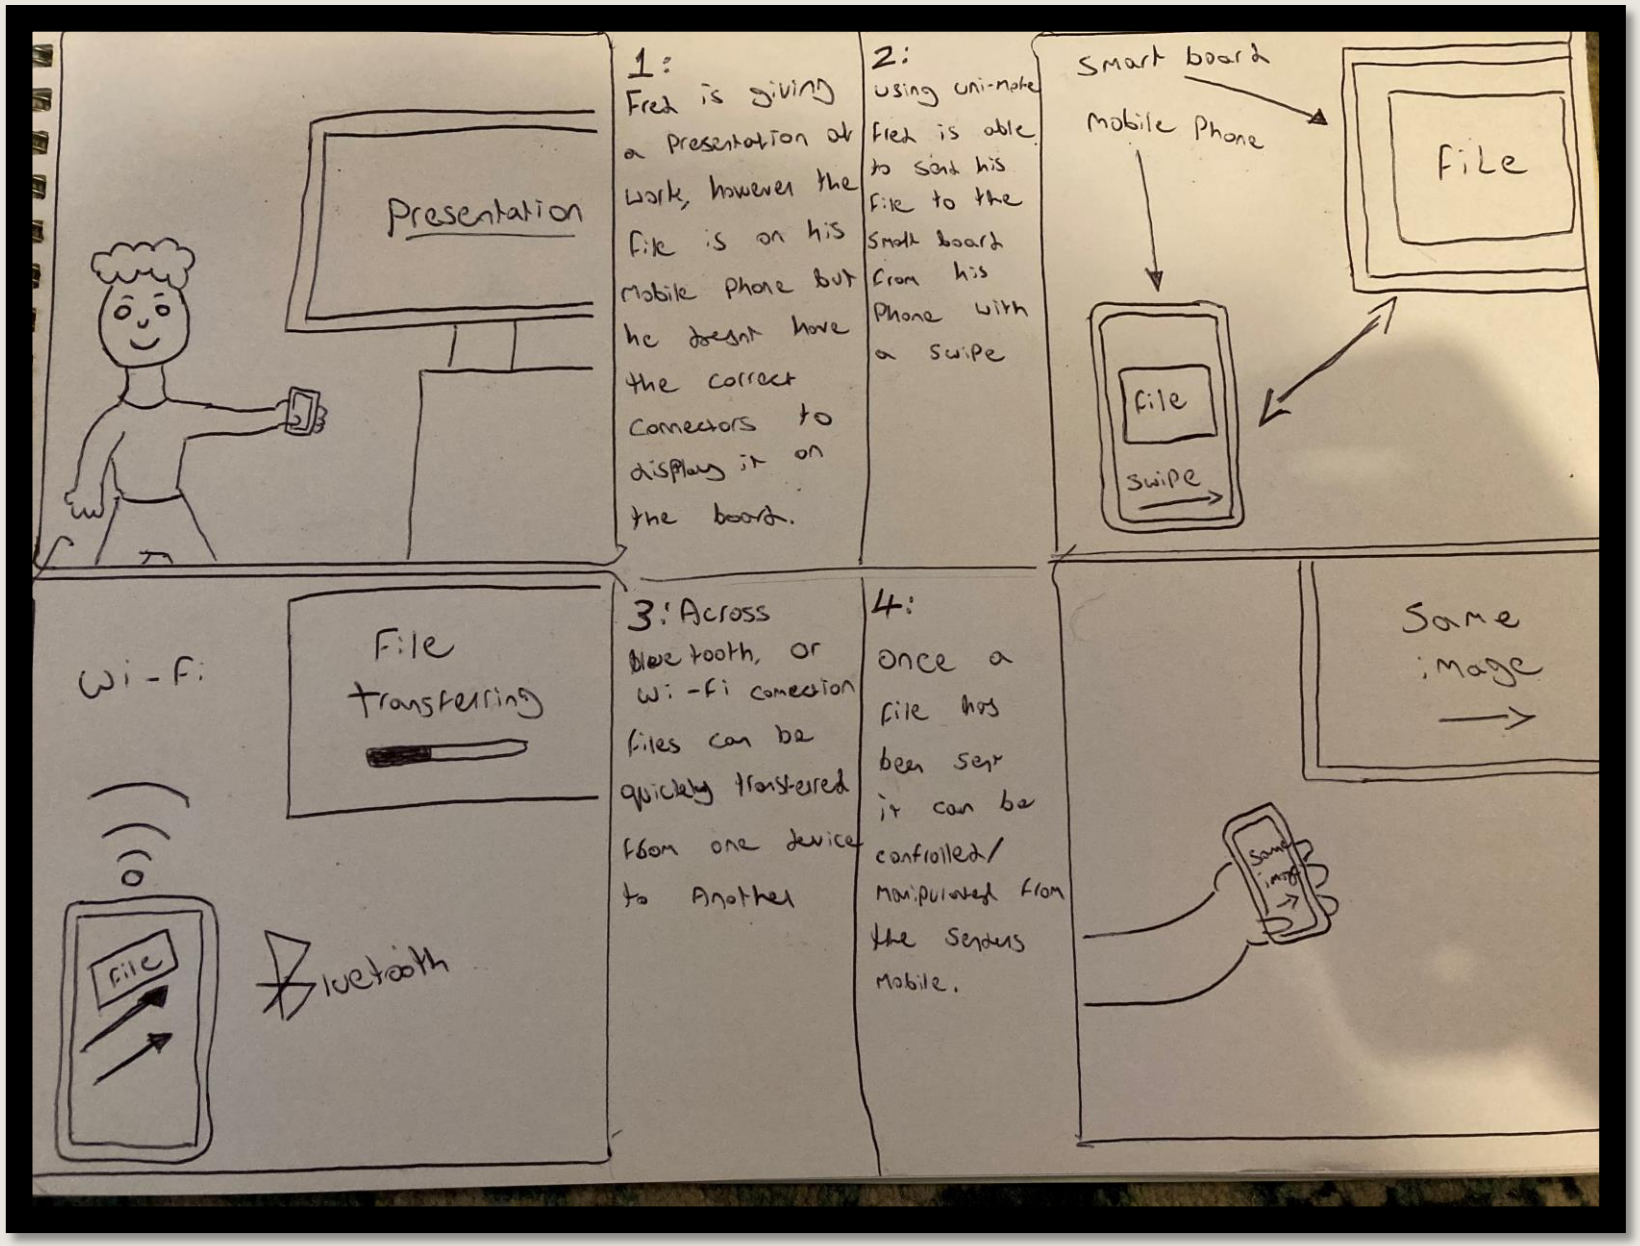

# SCENARIO 2: SMART SWIPE

1: A scenario for the user to encounter and how they would navigate through it.

Here our user “Fred” wants to be able to send the file from his mobile to the smart board for a presentation.

3: The user wants to be able to simply and quickly display his phone screen on his other smart surfaces.

Sending files from one device to another over Wi-Fi or Bluetooth

2: using the Uni-Mote mobile application to connect the two smart devices our user is able to transfer his files from one to the other.

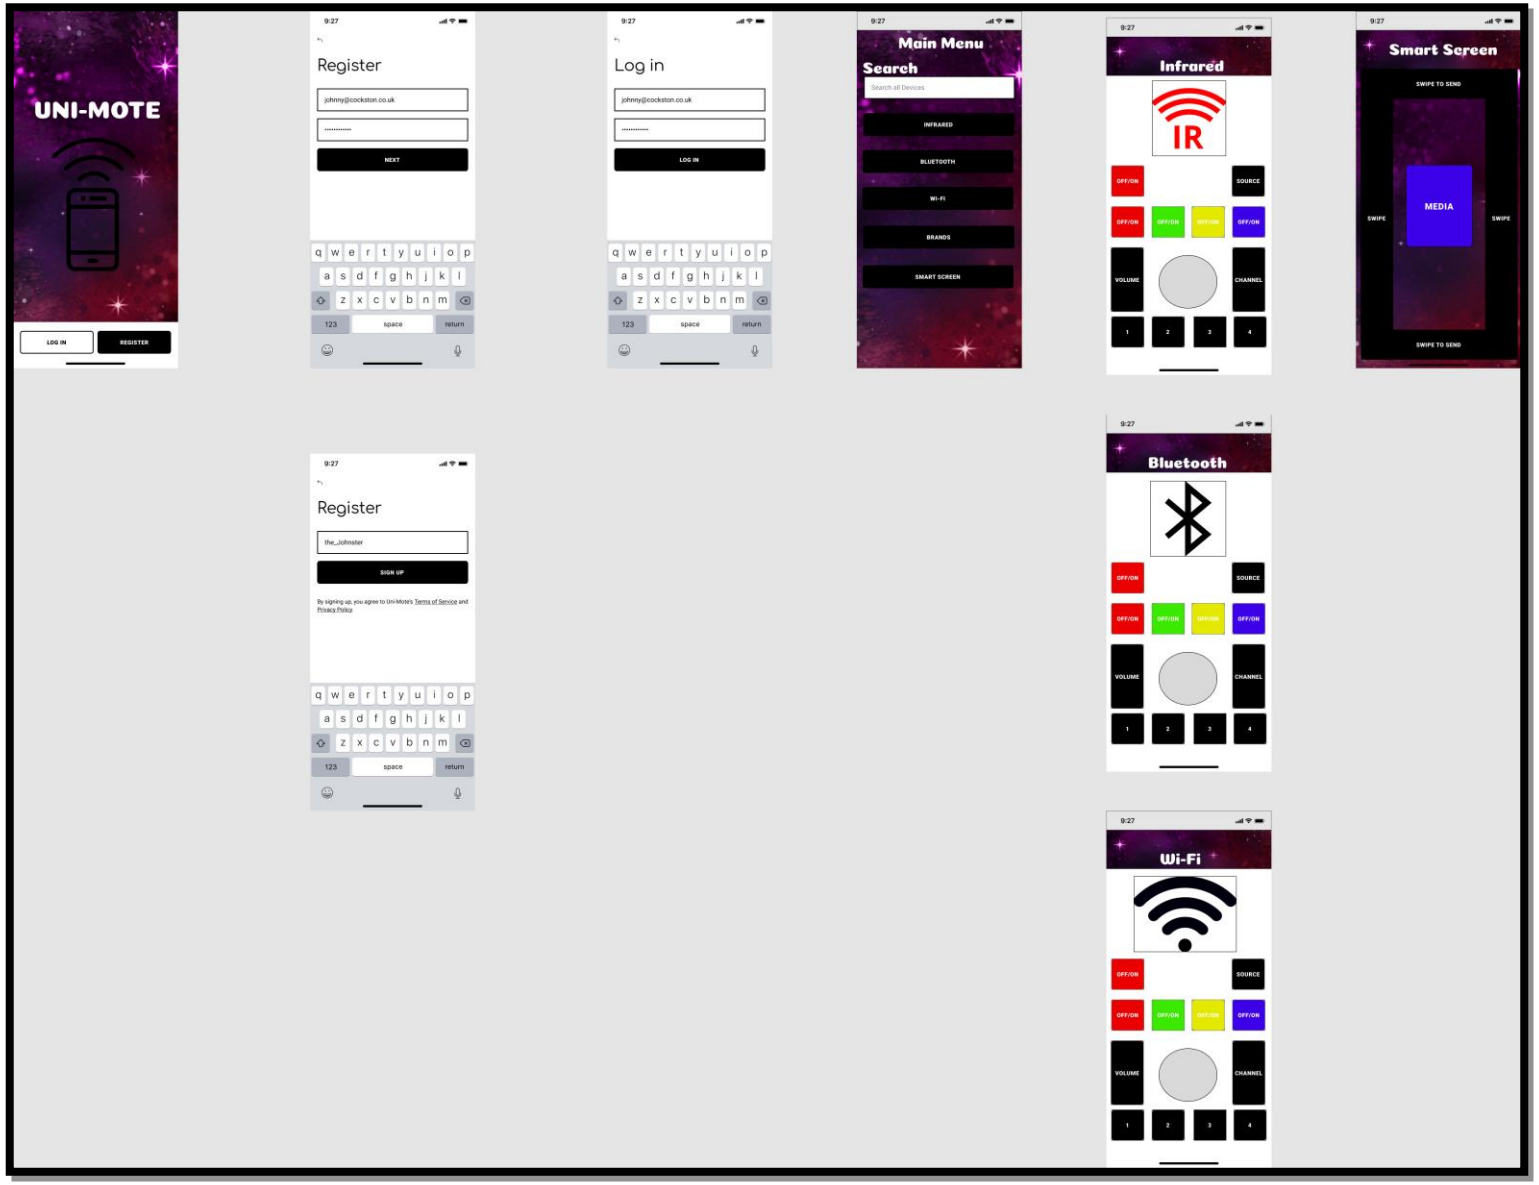

4: after the two smart devices have been connected and the files transferred the user should be able to manipulate the file live from their mobile phone.

# POLISHED PROTOTYPE – FIGMA

Figma Link

https://www.figma.com/file/LW3aF8eLTuzEu1fqA071RX/Beta-Prototype-in-Figma---UXD?node-id=0%3A1&t=rRN9CnJZN0Wxr7Ul-1

After going through a couple iterations with wire framing and alpha prototypes, then refining the designs in beta prototypes we end here.

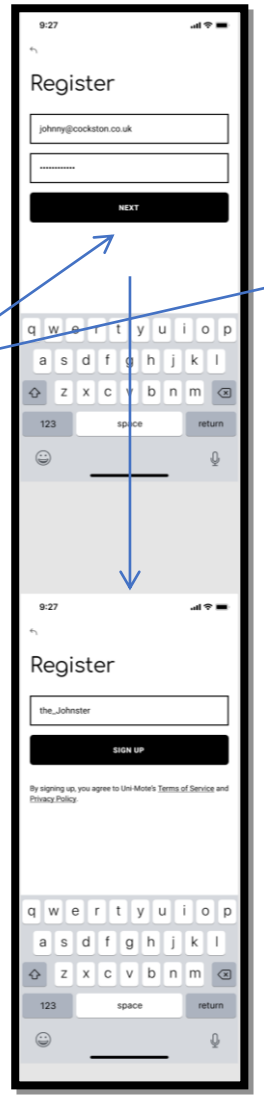

Three different screens, one for infrared, Bluetooth and wi-fi only devices as each one requires a different receiver.

A couple screens for new users to register accounts to allow for more functionality.

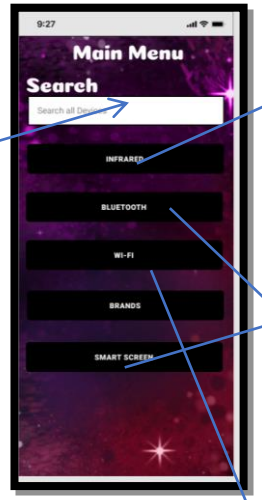

# POLISHED PROTOTYPE – FLOWS

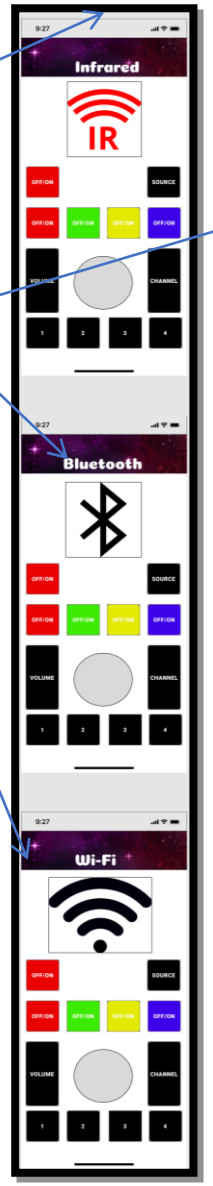

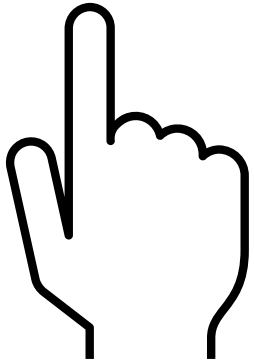

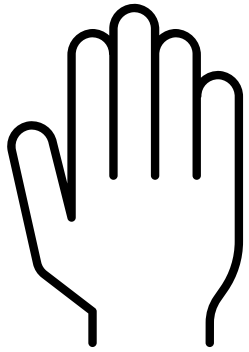

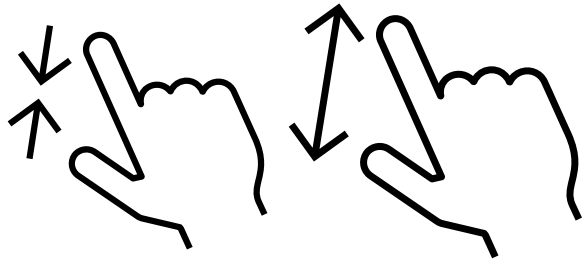

Click button

Swipe & Type

Click button

Squash, Stretch & Swipe

# IN CONCLUSION

At Uni-Mote mobile app, we believe in giving 110%. By using our next-generation mobile architecture, we help organizations and individuals virtually manage agile workflows. We thrive because of our market knowledge and great team behind our product. As our company motto goes, "Efficiencies will come from proactively transforming how we do business."

We will be able to interconnect all your devices, simply and effectively transferring files, media and presentations across various platforms by simply swiping it from your mobile-phone in the direction of the device you wish to display it.
